PRICE LIMITS

In respect of futures contracts, value ranges for Price Limits and trade invalidations are expressed as a number of ticks (unless otherwise specified) from the Price Limit Reference Price or PLRP. For instance, a value range of “14” for Futures indicates a limit bid which is 7 ticks above the PLRP and a limit offer which is 7 ticks below the PLRP e.g. if the PLRP is 99.54 the offer limit will be 99.47 and the bid limit 99.61. The value ranges expressed are the “normal” settings, although the ranges can be widened.

For the majority of futures contracts the PLRP for the most active contract month (“the blue month”) is the last traded price (or subsequent offers below/bids above that price). For all other contract months, the PLRP is a fair value for that contract month, with the fair value being calculated in real time from outright and implied spread relationships with the blue month. By taking their lead from the most active contract month, the price limits in other months remain up-to-date and therefore do not interrupt normal trading. This method of calculating the PLRP is referred to in the [Euronext Trading Procedures](#) as the “Central Order Book price method”, at **Euronext Trading Procedure 2.1.3.**

For some futures (e.g. single stock futures) contracts and currency futures contracts, the PLRP is calculated by Euronext as the price of the underlying security plus the cost of carry for each contract month. This method of calculating the PLRP is referred to in the Euronext Trading Procedures as the “theoretical fair value method”, at **Euronext Trading Procedure 2.1.4.**

Options Price Limits operate in broadly the same way as those for futures contracts. In the case of options contracts the “theoretical fair value method” is used. Euronext calculates a fair value price (PLRP) to which a spread value range is applied, outside of this range orders are rejected by the Trading Host. The width of the spread range is calculated by reference to a fair value price. Price Limits for options contracts are described in **Euronext Trading Procedure 2.1.6.**

The value ranges expressed are the “normal” settings, although the ranges can be widened.

The PLRP from the outright legs are used to calculate the PLRP for a strategy. For the strategy value ranges multipliers are used. Strategy Multipliers are a percentage of the value ranges in the outright strikes.

The option price for a delta neutral trade strategy order, should be at or within the set price limit range at submission of the order. The Delta used for a Delta Neutral strategy order should be within the maximum deviation of 10 delta points of the Euronext calculated delta.

SPIKING LIMITS

A Futures contract that uses Market Priced style price limits can additionally be configured to support Spiking Price Limits. The purpose of Spiking Price Limits is to apply a certain amount of ‘inertia’ to the movement of Dynamic Price Limits when the reference price is rapidly moving either up or down and constantly hitting the existing price limits. In this case, normal (i.e. non-spiking) price limits policy applies until the spiking functionality is triggered. Spiking is triggered when, as a result of orders trading in the Blue month, the Blue Month PLRP is moved to the lower or upper Outer Price Limit, and this occurs twice within a configured maximum triggered time.

Spiking Price Limits are then in operation for all expiries in the contract, until a Market Control Analyst switches spiking off and the contract is returned to normal price limits.

Spiking Price Limits cannot be triggered during Pre-Open or Uncrossing. When Spiking Price Limits have been triggered the Outer Price Limit Spread on the opposite side to the direction of the market move is doubled. The outer price limit spread on the side of the market move is adjusted by a spread offset according to the number of times the PLRP hits the outer price limit. Note that this means spiking price limits are not symmetrical around PLRP.

Note

When Spiking Price Limits are active the current Price Limit Multiplier is taken into account when calculating any new limits – e.g. if the Price Limit Multiplier is set to Wide then the Wide multiplier will be applied to the basic price limit spread prior to being used by the Spiking Price Limit calculation algorithm.

TRADE INVALIDATION

Euronext's arrangements in respect of trade invalidations are governed **by section 3.5 of the Euronext Trading Procedures** and associated implementing notice. The fundamental principle underlying the policy is that Price Limits prevent the vast majority of trades at unrepresentative prices and trades should be allowed to stand, and the market be allowed to operate without intervention by Euronext, except where exceptional circumstances dictate otherwise.

Euronext will not ordinarily invalidate trades that have occurred at prices within the value ranges set out in this document. An exception to this would be where the value range for the contract concerned temporarily failed to reflect the contract's fair value. In such exceptional circumstances, Euronext would be able to invalidate trades at unrepresentative prices, or orders which may give rise to trades at unrepresentative prices, if executed, irrespective of whether such trades (or orders) fell within or outside the contract's current value range. In so doing, Euronext exercises its discretion in order to fulfil its regulatory obligation to maintain fair and orderly markets.
